

# 16-Bit Dual-Supply Bus Transceiver with Configurable Voltage Translation and 3-State Outputs

## 1 FEATURES

- Control Input  $V_{IH}/V_{IL}$  Levels are Referenced to  $V_{CCA}$  Voltage
- Power-Supply Range:  $V_{CCA}$  and  $V_{CCB}$ : 1.65V to 5.5V
- Latch-up performance exceeds 100mA per
- JESD 78, Class II
- $V_{CC}$  isolation and  $V_{CC}$  disconnect ( $I_{OFF}$  - float) feature - If either  $V_{CC}$  supply is < 100mV or disconnected, all I/Os get pulled-down and then become high-impedance
- $I_{OFF}$ : Supports Partial-Power-Down Mode Operation
- Extended Temperature: -40°C to +125°C

## 2 APPLICATIONS

- Handset
- Smartphone
- Tablet
- Desktop PC

## 3 DESCRIPTIONS

This 16-bit non-inverting bus transceiver is a bidirectional voltage-level translator and can be used to establish digital switching compatibility between mixed-voltage systems. It uses two separate configurable power-supply rails, Both  $V_{CCA}$  and  $V_{CCB}$  supporting operating voltages from 1.65 V to 5.5V. A ports, DIR and  $\overline{OE}$  tracks the  $V_{CCA}$  supply and B ports tracks the  $V_{CCB}$  supply. This allows the support of both lower and higher logic signal levels while providing bidirectional translation capabilities between any of the 1.8V, 2.5V, 3.3V and 5.5V voltage nodes.

The RS16T245A is designed for asynchronous communication between two data buses. The logic levels of the direction-control (DIR) input and the output-enable ( $\overline{OE}$ ) input activate either the B-port outputs or the A-port outputs or place both output ports into the high-impedance mode. The device transmits data from the A bus to the B bus when the B-port outputs are activated, and from the B bus to the A bus when the A-port outputs are activated. The input circuitry on both A and B ports is always active and must have a logic HIGH or LOW level applied to prevent excess  $I_{CC}$  and  $I_{CCZ}$ .

This device is fully specified for partial-power-down applications using  $I_{OFF}$ . The  $I_{OFF}$  circuitry disables the outputs, preventing damaging current backflow through the device when it is powered down.

The  $V_{CC}$  isolation feature ensures that if either  $V_{CC}$  input is at GND, all outputs are in the high-impedance state.

To ensure the high-impedance state during power up or power down,  $\overline{OE}$  should be tied to  $V_{CC}$  through a pullup resistor, the minimum value of the resistor is determined by the current-sinking capability of the driver.

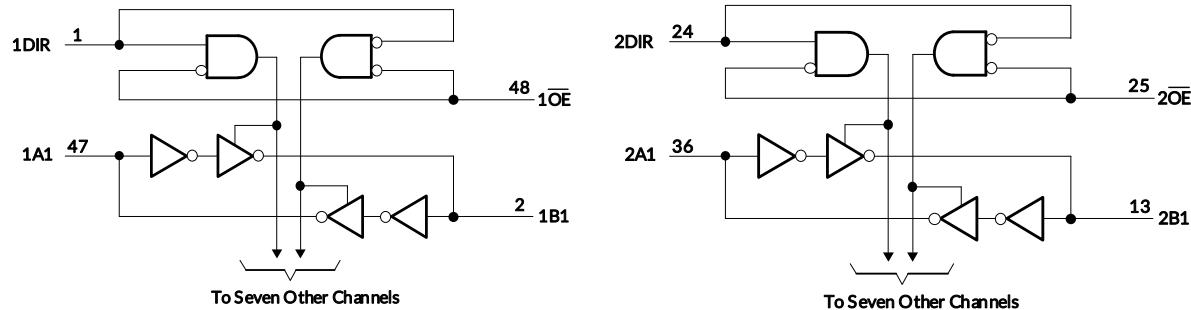

The RS16T245A is designed so that the control pins (DIR and  $\overline{OE}$ ) are supplied by  $V_{CCA}$ . It operates over an ambient temperature range of -40°C to +125°C.

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) The input and output negative-voltage ratings may be exceeded if the input and output current ratings are observed.

(3) The value of V<sub>CCA</sub> and V<sub>CCB</sub> are provided in the recommended operating conditions table.

(4) The package thermal impedance is calculated in accordance with JESD-51.

(5) The maximum power dissipation is a function of T<sub>J(MAX)</sub>, R<sub>θJA</sub>, and T<sub>A</sub>. The maximum allowable power dissipation at any ambient temperature is P<sub>D</sub> = (T<sub>J(MAX)</sub> - T<sub>A</sub>) / R<sub>θJA</sub>. All numbers apply for packages soldered directly onto a PCB.

### 8.2 ESD Ratings

The following ESD information is provided for handling of ESD-sensitive devices in an ESD protected area only.

		<b>VALUE</b>	<b>UNIT</b>
V <sub>(ESD)</sub>	Electrostatic discharge	Human-body model (HBM), MIL-STD-883K METHOD 3015.9	±2000
		Charged-device model (CDM), ANSI/ESDA/JEDEC JS-002-2018	±1000
		Machine model (MM), JESD22-A115C (2010)	±200

#### ESD SENSITIVITY CAUTION

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1)  $V_{CCI}$  is the  $V_{CC}$  associated with the data input port.

(2)  $V_{CCO}$  is the  $V_{CC}$  associated with the output port.

(3) All unused or driven (floating) data inputs (I/Os) of the device must be held at logic HIGH or LOW (preferably  $V_{CCI}$  or GND) to ensure proper device operation and minimize power.

(4) All unused control inputs must be held at  $V_{CCA}$  or GND to ensure proper device operation and minimize power consumption.

(5) For  $V_{CCI}$  values not specified in the data sheet,  $V_{IH\ min} = V_{CCI} \times 0.7\text{ V}$ ,  $V_{IL\ max} = V_{CCI} \times 0.3\text{ V}$ .

(6) For  $V_{CCA}$  values not specified in the data sheet,  $V_{IH\ min} = V_{CCA} \times 0.7\text{ V}$ ,  $V_{IL\ max} = V_{CCA} \times 0.3\text{ V}$ .

(1) V<sub>CCI</sub> is the V<sub>CC</sub> associated with the input port.

(2) V<sub>CCO</sub> is the V<sub>CC</sub> associated with the output port.

(3) Limits are 100% production tested at 25°C. Limits over the operating temperature range are ensured through correlations using statistical quality control (SQC) method.

(4) Typical values represent the most likely parametric norm as determined at the time of characterization. Actual typical values may vary over time and will also depend on the application and configuration.

(5) For I/O ports, the parameter I<sub>OZ</sub> includes the input leakage current.

(6) Hold all unused data inputs of the device at V<sub>CCI</sub> or GND to assure proper device operation.

- NOTES:
- A. C. includes probe and jig capacitance.
  - B. Waveform 1 is for an output with internal conditions such that the output is low, except when disabled by the output control. Waveform 2 is for an output with internal conditions such that the output is high, except when disabled by the output control.
  - C. All input pulses are supplied by generators having the following characteristics: PRR≤10 MHz,  $Z_o = 50 \Omega$ ,  $dv/dt \geq 1V/ns$ .
  - D. The outputs are measured one at a time, with one transition per measurement.
  - E.  $t_{PLZ}$  and  $t_{PHZ}$  are the same as  $t_{dis}$ .
  - F.  $t_{PZL}$  and  $t_{PZH}$  are the same as  $t_{en}$ .
  - G.  $t_{PLH}$  and  $t_{PHL}$  are the same as  $t_{pd}$ .
  - H. All parameters and waveforms are not applicable to all devices.

## 10 Application Information

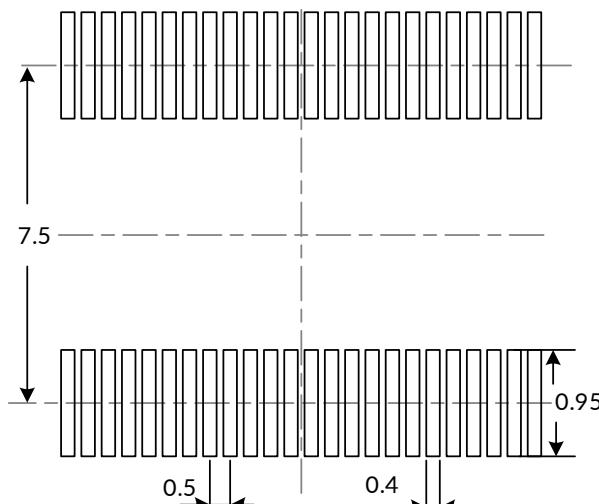

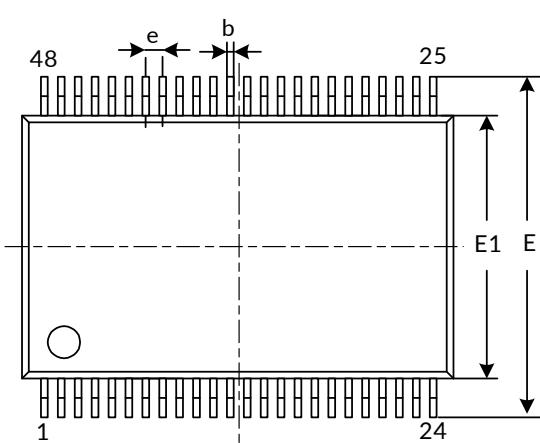

The RS16T245A device can be used in level-translation applications for interfacing devices or systems operating at different interface voltages with one another. The maximum output current can be up to 32 mA when device is powered by 5 V.
